Draft · video edition. Play the source demonstrations online. The complete Photoshop manual run and classroom cold run remain open.

LEARNING STUDIO · Multimedia12

Night Shift · understand the composite

Read or listen first. Then open the workbook and build it. 12 slides · 4 checkpoints · about 8 minutes.

Jump to a slide

NIGHT SHIFT · KNOWLEDGE FIRST · 1 of 12

What makes the illusion convincing?

Demonstration · 0:34

Original portrait from the source video.

Open on YouTube at 0:34 · Internet required.

Predict before the explanation.

Look for changes in shape, value, colour and texture—not a count of effects.

PAUSE · YOUR TURN

Name one change you would make and predict how a viewer would interpret it.

▼ **Explanation (what the narrator says)**

Show the original and ask students what would need to change to communicate an altered character. Gather two ideas and connect them to shape, light-dark value, colour and material. Explain that the finished reference is by the source creator, not work generated for this course.

Give the image one focal job.

Demonstration · 1:39

Local bone detail is revealed; the whole skull is not displayed.

Open on YouTube at 1:39 · Internet required.

Choose a main effect and a supporting effect. Keep the person recognisable and the light coherent.

▼ **Explanation (what the narrator says)**

Explain that a strong composition directs attention. The viewer should not have to inspect every square centimetre. Point to the local bone detail and ask which other effects support it. Students will choose their own audience and style rather than reproduce the creator’s exact face.

A mask answers: where?

Demonstration · 1:39

Local bone detail is revealed; the whole skull is not displayed.

Open on YouTube at 1:39 · Internet required.

White reveals. Black hides. Grey partly reveals. Select the mask thumbnail before painting.

CHECKPOINT · TRY BEFORE CHECKING

The black mask hides SKULL. How can you reveal a small bone area?

- Paint white on SKULL's mask
- Paint white on the portrait pixels
- Lower the whole portrait opacity

Practice only. Nothing you pick is saved or sent.

▼ **Explanation (what the narrator says)**

The photograph supplies information. Its layer mask controls where that information appears. Black on a mask does not paint a black wound: it hides part of the layer. White restores it. Ask students to point to the target thumbnail before predicting what a white brush will do.

Blend If answers: which tones?

Demonstration · 1:27

Underlying Layer's split dark control responds to the portrait below.

Open on YouTube at 1:27 · Internet required.

This Layer tests the active source. Underlying Layer tests the visible image below. Split a slider with Option/Alt for a gradual transition.

PAUSE · YOUR TURN

Point to the row you would use to remove dark pixels from the source photo itself.

▼ **Explanation (what the narrator says)**

Distinguish the two rows before touching a triangle. Benny's skull example splits the dark Underlying Layer control. A black source-photo background is a different problem and may need the dark This Layer control. Do not teach a single copied slider setting as universal.

Clipping answers: which base?

Demonstration · 8:02

Clipping limits a correction; masking limits its location.

Open on YouTube at 8:02 · Internet required.

A clipped correction is restricted by its base layer/group. Its own mask still controls local visibility.

CHECKPOINT · TRY BEFORE CHECKING

A colour correction affects the background too. What do you check first?

- The clipping/base relationship
- The export file name
- Whether another texture can hide it

Practice only. Nothing you pick is saved or sent.

▼ **Explanation (what the narrator says)**

Clipping and layer masks are not synonyms. Explain that the clipping relationship limits the correction to the relevant source, while a black adjustment mask can keep that correction hidden until the student reveals it in selected regions. Inspect the source’s clipping arrows.

Light explains the form.

Demonstration · 4:47

Source socket/cheek darkening explains form.

Open on YouTube at 4:47 · Internet required.

Recesses and overhangs need a consistent explanation. Preserve material detail instead of producing a featureless black patch.

▼ **Explanation (what the narrator says)**

Point to the sockets and cheek hollows. Explain that controlled local darkening changes perceived form, while uniform darkening merely changes exposure. Ask where the original key light comes from and how the added material should respond.

A source photo has jobs and distractions.

Demonstration · 6:26

A real source contains a useful opening and rim.

Open on YouTube at 6:26 · Internet required.

Keep the useful grain, opening or rim. Remove the object outline, backing and irrelevant context.

PAUSE · YOUR TURN

Identify the useful region and two parts you would exclude.

▼ Explanation (what the narrator says)

The source food photo is useful because it contains real material transitions. It is not useful as an entire rectangular object pasted on a forehead. Students should justify crop, grain direction, scale and light. The local practice texture is a different photograph and needs different settings.

Colour and value solve different mismatches.

Demonstration · 4:47

Source socket/cheek darkening explains form.

Open on YouTube at 4:47 · Internet required.

Value: light–dark structure. Colour: hue and saturation. Neither corrects a misaligned feature.

CHECKPOINT · TRY BEFORE CHECKING

An insert is too red but correctly positioned. What is a sensible first test?

- A clipped colour adjustment
- A larger Warp
- Flattening the file

Practice only. Nothing you pick is saved or sent.

▼ **Explanation (what the narrator says)**

Name the observed mismatch first. If a patch is in the wrong place, transform it. If its border shows, inspect the mask. If it is too red, adjust colour. If it is too bright, adjust tone. This diagnosis order prevents piling effects onto the wrong problem.

NIGHT SHIFT · KNOWLEDGE FIRST · 9 of 12

Keep a revisable finishing pass.

Demonstration · 9:32

A finishing copy sits above retained source layers.

Open on YouTube at 9:32 · Internet required.

Stamp a visible copy above the layers. Convert the copy to a Smart Object. Keep the original build.

▼ **Explanation (what the narrator says)**

Explain the distinction between stamping and flattening. A separate composite can be polished without deleting the source construction. The evidence is the actual reopened layered file, not an export image or a checkbox.

NIGHT SHIFT · KNOWLEDGE FIRST · 10 of 12

Practice → changed condition → independent choice.

Demonstration · 8:02

Clipping limits a correction; masking limits its location.

Open on YouTube at 8:02 · Internet required.

Predict. Edit one control. Compare. Explain. Then repeat on a changed source or region.

PAUSE · YOUR TURN

Without looking at the directions, name the control for a misplaced feature, a hard rectangle and an unwanted colour cast.

▼ **Explanation (what the narrator says)**

Demonstrate once, then reduce procedural help. Ask students to show a skill without reading the steps, diagnose a mismatch and defend a choice. Use product, observation and conversation together; support use remains separate from achievement.

Feedback must change the next version.

Demonstration · 1:39

Local bone detail is revealed; the whole skull is not displayed.

Open on YouTube at 1:39 · Internet required.

Keep the first attempt, one specific feedback point and a revised result.

CHECKPOINT · TRY BEFORE CHECKING

Which revision record best demonstrates learning?

- Before/after plus the control choice and reason
- Only the final PNG
- A list of effects copied from the tutorial

Practice only. Nothing you pick is saved or sent.

▼ **Explanation (what the narrator says)**

Feedback should identify what works, what to improve and a concrete next step tied to the taught skill. Ask the student to show the visible change and explain why the revision is stronger. Do not use tutorial completion as a substitute for this evidence.

What you need to know before starting.

Demonstration · 1:27

Underlying Layer's split dark control responds to the portrait below.

Open on YouTube at 1:27 · Internet required.

- Mask = location.
- Blend If = tonal test.
- Clipping = affected base.
- Transform = alignment.
- Colour/value/light = integration.

PAUSE · YOUR TURN

Open the workbook. Complete the core local reveal before choosing advanced jaw or texture extensions.

▼ **Explanation (what the narrator says)**

Ask each student to explain one relationship without reading it. Resolve misunderstandings before they begin the skull reveal. The first practice target is small: align one feature, make a reversible local reveal and explain the selected control.
